

Angular Hands-On 5 Report

Aim

To implement a Reactive Enrollment Form using Angular Reactive Forms with built-in validators, custom validators, asynchronous validation, and dynamic form controls.

Work Done

- Generated the ReactiveEnrollmentFormComponent using Angular CLI.
- Added the /enroll-reactive route in the routing configuration.
- Imported ReactiveFormsModule into the application.
- Created the reactive form using FormBuilder.
- Applied built-in validators for form fields.
- Implemented a custom synchronous validator (noCourseCode).
- Implemented a custom asynchronous validator (simulateEmailCheck).
- Used FormArray to add and remove additional course entries dynamically.

Verification

- Reactive enrollment form loaded successfully.
- Built-in validators validated user input correctly.
- Custom synchronous validator prevented invalid course codes.
- Asynchronous validator checked email availability.
- Additional courses were added and removed dynamically using FormArray.

Result

Hands-On 5 was completed successfully. A reactive enrollment form was developed using Angular Reactive Forms with built-in validation, custom synchronous and asynchronous validators, and dynamic FormArray functionality.
